

We are an AISC Certified fabricator and have procedures in place to document the *owner's designated representatives for design and construction* approval of shop drawings. On a design-build project, where we have a contract to design, fabricate and erect the structure, do we have to get the owner's approval in writing of any design changes that take place throughout the design/detail process? Do we need to obtain a written waiver of approval from the owner to comply with the certification standard? Who is the designated representative?
